

Figure Clinic Handout

Gestalt Principles Applied to Agricultural Figures

INSTRUCTIONS

Work in pairs. For each figure:

- Use the analysis table to identify which Gestalt principles are violated or respected and note what you observe.
- Be ready to share your findings with the class.

Figure 1 Gaussian membership functions for greenhouse variables

Figure 5. MFs are defined via Gaussian shapes: (a) temperature; (b) humidity; and (c) soil moisture.

Figure 3 Relative reproductive priority vs. cumulative maternal investment in dairy cattle

Figure 2 Probability of detecting ovulation by oestrous behaviour according to average milk yield in the week of oestrus in Holstein (—, $n = 255$ ovulations) and Normande (---, $n = 332$) dairy cows submitted to a either high or low feeding level. Probabilities were predicted in a model accounting for the presence of a herdmate in oestrus, oestrus observation period (breeding period or before), body condition score over the week of oestrus centred within breed, breed, milk yield over the week of oestrus and the interaction between these two variables. The milk yield effect is highly significant ($P < 0.0001$). Data from Cutullic, Delaby and Disenhaus (unpublished).

Propose an improvement

Choose the figure you found most confusing. Describe or sketch one specific change and justify it using a Gestalt principle.

YOUR IMPROVEMENT	JUSTIFICATION (which principle and why)
Describe or sketch your proposed change here	Explain the perceptual reasoning behind your change

Exit ticket (to hand in at the end of class)

Name a Gestalt principle that caught your attention or that you realized you weren't using, and describe how you would apply it to your next figure.
